AUGMENTED WOODWORKING

Adviser:
Axel Roesler
Sang-gyeun Ahn

In woodworking, a tactile industry where craftsmen transform raw materials into artifacts, it is important to produce quality products in an efficient manner without compromising safety. Through the lens of woodworking, this thesis examines new design principles for augmented reality (AR) to create intuitive experiences in hands-on industries. AR is a relatively new technology that can enhance the efficiency of a user by displaying relevant virtual information directly in their physical environment.
